1 Area of Expertise

Cutting-edge research in intelligent software and transfer of technology exploiting such research in the specification and implementation of intelligent systems and applications.

2 Statement of Interest

I am generally fascinated with schemes of reasoning and computation and the structure of language, whether artificial or natural, to formulate them. I view all formal reasoning as mathematical constraint-solving in some algebraic structure.

I have a solid experience in formal design and efficient implementation of very high-level and multi-paradigm software development environments, with an immediate, but not exclusive, emphasis on web-based computing, rule-based and constraint-based programming, object-orientation, logic and functional programming. I am also interested in combining (symbolic) Artificial Intelligence (AI) with (numerical) optimization as done in Operations Research (OR) and Probabilistic Models (Bayesian Reasoning).

Areas of application are: specification, implementation, and optimization of business and government organizational logistics, analytics, automated reasoning, computational linguistics, knowledge representation and acquisition, “Semantic Web” (XML, RDF(a,Schema), Linked Data, SKOS, SPARQL, JSON, JSON-LD, Topic Maps, etc.), machine learning, data mining bioinformatics, etc., . . .
